$\frac{3}{4} + \frac{2}{3} = \square$

$= \frac{9}{12} + \frac{8}{12}$

$= \frac{17}{12}$

$= 1\frac{5}{12}$

Write both as $\frac{1}{12}$s.

1. $\frac{2}{5} + 4 = \square$
2. $\frac{2}{3} + \frac{5}{6} = \square$
3. $\frac{2}{5} + \frac{2}{3} = \square$
4. $\frac{3}{4} + \frac{1}{5} = \square$
5. $\frac{2}{3} + \frac{2}{4} = \square$
6. $\frac{7}{8} - \frac{2}{3} = \square$
7. $\frac{2}{5} - \frac{1}{6} = \square$
8. $1\frac{2}{9} - \frac{2}{3} = \square$
9. $1\frac{4}{5} - \frac{3}{4} = \square$
10. $\frac{8}{9} - \frac{1}{5} = \square$

Write both fractions out with the same denominator.

THINK How can you use what you have just practised to work out $\frac{2}{5} + 0{\cdot}8$? What is the answer?

I am confident with adding and subtracting fractions.
